

diasmoke

DIASMOKE is a new and exciting international clinical trial for Diabetic Smokers!

Study Title: Metabolic Syndrome in Diabetic Smokers using Cigarettes & Combustion-Free Nicotine Delivery Systems

We are investigating whether switching from conventional cigarettes to e-cigarettes reduces the risk of cardiovascular (heart and circulation) disease as compared to normal smoking in diabetics. The results of the study may help us to understand more about the risks and benefits of vaping/e-cigarettes use compared to conventional cigarette smoking for diabetics who are smokers.

The Research and Development team would like to invite eligible Diabetic Smokers to take part in this study.

Please contact the Research Team for more details:
